Economics 101A (Lecture 9)

Stefano DellaVigna

September 28, 2004

Outline

- 1. Labor Supply
- 2. Intertemporal choice

1 Labor Supply

- Nicholson Ch. 16, pp. 477–484 [OLD: Ch. 22, pp. 606–613.]
- Labor supply decision: how much to work in a day.

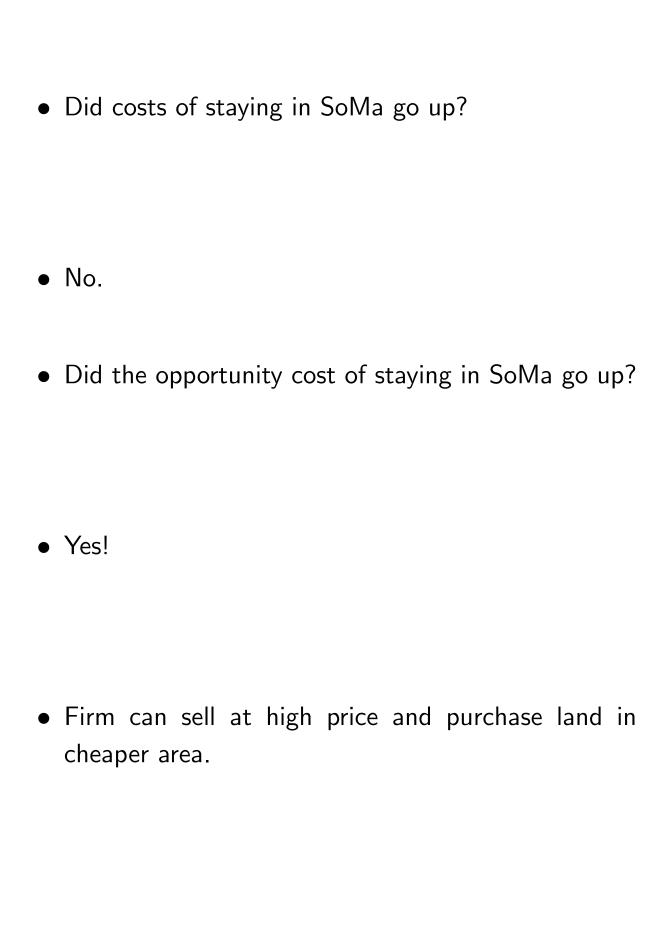

- ullet Goods: consumption good c, hours worked h
- ullet Price of good p, hourly wage w
- ullet Consumer spends 24-h=l hours in units of leisure

• Utilify function: u(c, l)

- Budget constraint?
- Income of consumer: M + wh = M + w(24 l)
- ullet Budget constraint: $pc \leq M + w(24-l)$ or $pc + wl \leq M + 24w$
- ullet Notice: leisure l is a consumption good with price w. Why?
- General category: **opportunity cost**
- Instead of enjoying one hour of TV, I could have worked one hour and gained wage w.
- ullet You should value the marginal hour of TV w!

| • | Opportunity costs are very important! |
|---|---|
| • | Example 2. CostCo has a warehouse in SoMa |
| • | SoMa used to have low cost land, adequate for ware-houses |
| • | Price of land in SoMa triples in 10 years. |
| • | Should firm relocate the warehouse? |
| | |

_

- Let's go back to labor supply
- Maximization problem is

$$\max u(c, l)$$

$$s.t. \ pc + wl \le M + 24w$$

- Standard problem (except for 24w)
- First order conditions

• Assume utility function Cobb-Douglas:

$$u(c,l) = c^{\alpha} l^{1-\alpha}$$

Solution is

$$c^* = \alpha \frac{M + 24w}{p}$$

$$l^* = (1 - \alpha) \left(24 + \frac{M}{w}\right)$$

- ullet Both c and l are normal goods
- ullet Unlike in standard Cobb-Douglas problems, c^* depends on price of other good w
- ullet Why? Agents are endowed with M AND 24 hours of l in this economy
- ullet Normally, agents are only endowed with M

2 Intertemporal choice

- Nicholson Ch. 17, pp. 502–506 [OLD: Ch. 23, pp. 628–632.]
- So far, we assumed people live for one period only
- Now assume that people live for two periods:
 - t=0 people are young
 - $-\ t=1$ people are old

- t=0: income M_0 , consumption c_0 at price $p_0=1$
- t=1: income $M_1>M_0$, consumption c_1 at price $p_1=1$

 \bullet Credit market available: can lend or borrow at interest rate r

- Budget constraint in period 1?
- Sources of income:

$$- M_{1}$$

$$- (M_0 - c_0) * (1 + r)$$
 (this can be negative)

• Budget constraint:

$$c_1 \leq M_1 + (M_0 - c_0) * (1 + r)$$

or

$$c_0 + \frac{1}{1+r}c_1 \le M_0 + \frac{1}{1+r}M_1$$

- Utility function?
- Assume

$$u(c_0, c_1) = U(c_0) + \frac{1}{1+\delta}U(c_1)$$

- U' > 0, U'' < 0
- \bullet δ is the discount rate
- ullet Higher δ means higher impatience

- ullet Elicitation of δ through hypothetical questions
- ullet Person is indifferent between 1 hour of TV today and $1+\delta$ hours of TV next period

• Maximization problem:

$$\max U(c_0) + \frac{1}{1+\delta}U(c_1)$$

$$s.t. \ c_0 + \frac{1}{1+r}c_1 \le M_0 + \frac{1}{1+r}M_1$$

- Lagrangean
- First order conditions:
- Ratio of f.o.c.s:

$$\frac{U'(c_0)}{U'(c_1)} = \frac{1+r}{1+\delta}$$

• Case
$$r = \delta$$

$$- c_0^* c_1^*$$
?

– Substitute into budget constraint using $c_0^* = c_1^* = c^*$:

$$\frac{2+r}{1+r}c^* = \left[M_0 + \frac{1}{1+r}M_1\right]$$

or

$$c^* = \frac{1+r}{2+r}M_0 + \frac{1}{2+r}M_1$$

- We solved problem virtually without any assumption on U!
- Notice: $M_0 < c^* < M_1$

• Case
$$r > \delta$$

$$-c_0^*$$
 c_1^* ?

- ullet Comparative statics with respect to income M_0
- Rewrite ratio of f.o.c.s as

$$U'(c_0) - \frac{1+r}{1+\delta}U'(c_1) = 0$$

• Substitute c_1 in using $c_1 = M_1 + (M_0 - c_0)(1 + r)$ to get

$$U'(c_0) - \frac{1+r}{1+\delta}U'(M_1 + (M_0 - c_0)(1+r)) = 0$$

Apply implicit function theorem:

$$\frac{\partial c_0^*(r, \mathbf{M})}{\partial M_0} = -\frac{-\frac{1+r}{1+\delta}U''(c_1)(1+r)}{U''(c_0) - \frac{1+r}{1+\delta}U''(c_1)*(-(1+r))}$$

• Denominator is always negative

Numerator is positive

• $\partial c_0^*(r, \mathbf{M})/\partial M_0 > 0$ — consumption at time 0 is a normal good.

ullet Can also show $\partial c_0^*\left(r,\mathbf{M}
ight)/\partial M_1>0$

- ullet Comparative statics with respect to interest rate r
- Apply implicit function theorem:

$$\frac{\partial c_0^*(r, \mathbf{M})}{\partial r} = -\frac{\frac{-\frac{1}{1+\delta}U'(c_1)}{U''(c_0) - \frac{1+r}{1+\delta}U''(c_1) * (-(1+r))}}{-\frac{\frac{-1+r}{1+\delta}U''(c_1) * (M_0 - c_0)}{U''(c_0) - \frac{1+r}{1+\delta}U''(c_1) * (-(1+r))}}$$

• Denominator is always negative

- Numerator: First term negative (substitution eff.)
- Numerator: Second term (income effect:)
 - positive if $M_0 > c_0$
 - negative if $M_0 < c_0$.
