Economics 101A (Lecture 21)

Stefano DellaVigna

November 11, 2009

Outline

- 1. Oligopoly: Cournot
- 2. Oligopoly: Bertrand
- 3. Second-price Auction
- 4. Auctions: eBay Evidence

1 Oligopoly: Cournot

- Nicholson, Ch. 14, pp. 524-530 (*better* than Ch. 14, pp. 418–419, 421–422, 9th)
- Back to oligopoly maximization problem
- Assume 2 firms, cost $c_i(y_i) = cy_i, i = 1, 2$
- Firms choose simultaneously quantity y_i
- Firm *i* maximizes:

$$\max_{y_i} p\left(y_i + y_{-i}\right) y_i - c y_i.$$

• First order condition with respect to y_i :

$$p_Y'\left(y_i^*+y_{-i}^*\right)y_i^*+p-c=\mathsf{0},\,\,i=\mathsf{1},\mathsf{2}.$$

- Nash equilibrium:
 - y_1 optimal given y_2 ;
 - y_2 optimal given y_1 .
- Solve equations:

$$p_Y^\prime \left(y_1^st + y_2^st
ight) y_1^st + p - c = {\sf 0}$$
 and $p_Y^\prime \left(y_2^st + y_1^st
ight) y_2^st + p - c = {\sf 0}.$

- Cournot -> Pricing above marginal cost
- Numerical example -> Problem set 5

2 Oligopoly: Bertrand

- Cournot oligopoly: firms choose quantities
- Bertrand oligopoly: firms first choose prices, and then produce quantity demanded by market
- Market demand function Y(p)
- 2 firms
- Profits:

$$\pi_{i}(p_{i}, p_{-i}) = \begin{cases} (p_{i} - c) Y(p_{i}) & \text{if } p_{i} < p_{-i} \\ (p_{i} - c) Y(p_{i}) / 2 & \text{if } p_{i} = p_{-i} \\ 0 & \text{if } p_{i} > p_{-i} \end{cases}$$

• First show that $p_1 = c = p_2$ is Nash Equilibrium

- Does any firm have a (strict) incentive to deviate?
- Check profits for Firm 1

• Symmetric argument for Firm 2

- Second, show that this equilibrium is unique.
- For each of the next 5 cases at least on firm has a profitable deviation
- Case 1. $p_1 > p_2 > c$

• Case 2. $p_1 = p_2 > c$

• Case 3. $p_1 > c \ge p_2$

• Case 4. $c > p_1 \ge p_2$

• Case 5. $p_1 = c > p_2$

- Only Case 6 remains: $p_1 = c = p_2$, which is Nash Equilibrium
- It is unique!

- Notice:
- To show that something is an equilibrium -> Show that there is *no* profitable deviation
- To show that something is *not* an equilibrium ->
 Show that there is *one* profitable deviation

- Surprising result of Bertrand Competition
- Marginal cost pricing

• Two firms are enough to guarantee perfect competition!

• Realistic? Price wars between PC makers

3 Second-price Auction

- Nicholson, Ch. 18, pp. 659–66 [Not in old book]
- Sealed-bid auction
- Highest bidder wins object
- Price paid is second highest price

- Two individuals: I = 2
- Strategy s_i is bid b_i
- Each individual knows value v_i

• Payoff for individual i is

$$u_i(b_i, b_{-i}) = \begin{cases} v_i - b_{-i} & \text{if } b_i > b_{-i} \\ (v_i - b_{-i})/2 & \text{if } b_i = b_{-i} \\ 0 & \text{if } b_i < b_{-i} \end{cases}$$

- Show: weakly dominant to set $b_i^* = v_i$
- To show:

$$u_i(v_i, b_{-i}) \ge u_i(b_i, b_{-i})$$

for all b_i , for all b_{-i} , and for i = 1, 2.

- 1. Assume $b_{-i} > v_i$
 - $u_i(v_i, b_{-i}) = 0 = u_i(b_i, b_{-i})$ for any $b_i < b_{-i}$
 - $u_i(b_{-i}, b_{-i}) = (v_i b_{-i})/2 < 0$
 - $u_i(b_i, b_{-i}) = (v_i b_{-i}) < 0$ for any $b_i > b_{-i}$

2. Assume now $b_{-i} = v_i$

3. Assume now $b_{-i} < v_i$

4 Auctions: Evidence from eBay

- In second-price auction, optimal strategy is to bid one's own value
- Is this true?
- eBay has proxy system: If you have highest bid, you pay bid of second-highest bidder
- eBay is essentially a second-price auction
- Two deviations:
 - People bid multiple times they should not in this theory
 - 2. People may overbid

An example: eBay Bidding for a Board Game

- Bidding environment with clear boundary for rational willingness to pay ("buy-it-now price").
- Empirical environment unaffected by common-value arguments (presumably bidding for private use; in addition "buy-it-now" price).
- Still non-negligible amount (\$100-\$200).
- \rightarrow Is there evidence of overbidding?
- \rightarrow If so, can we detect determinants of overbidding?

The Object

The Data

- Cashflow 101: board game with the purpose of finance/accounting education.
- Retail price : \$195 plus shipping cost (\$10.75) from manufacturer (*www.richdad.com*).
- Two ways to purchase Cashflow 101 on eBay
 - Auction (quasi-second price proxy bidding)
 - Buy-it-now
- Hand-collected data of all auctions and Buy-itnow transactions of Cashflow 101 on eBay from 2/19/2004 to 9/6/2004.

Sample

- Listings
 - 206 by individuals (187 auctions only, 19 auctions with buy-it-now option)
 - 493 by two retailers (only buy-it-now)
- Remove non-US\$, terminated, unsold items and items without simultaneous *professional* buy-it-now listing. → 169 auctions
- Buy-it-now offers of the two retailers
 - Continuously present for all but six days. (Often individual buy-itnow offers present as well; they are often lower.)
 - 100% and 99.9% positive feedback scores.
 - Same prices \$129.95 until 07/31/2004; \$139.95 since 08/01/2004.
 - Shipping cost \$9.95; other retailer \$10.95.
 - New items (with bonus tapes/video).

Hypotheses

Given the information on the listing website:

- (H1) An auction should never end at a price above the concurrently available purchase price.
- (H2) Mentioning of higher outside prices should not affect bidding behavior.

<u>Figure 1. Starting Price</u> (*startprice*)

- → 45% below \$20; mean=\$46; SD=43.88
- \rightarrow only 6 auctions with first <u>bid</u> (not price) above buy-it-now

<u>Figure 2. Final Price</u> (*finalprice*)

→ 41% are above "buy-it-now" (mean \$132; SD 16.83)

Figure 4. Total Price (incl. shipping cost) → 51% are above "buy-it-now" plus its shipping cost (mean=\$144.20; SD=15.00)
