

# Economics 101A

## (Lecture 5)

Stefano DellaVigna

February 3, 2009

## Outline

1. Properties of Preferences
2. From Preferences to Utility (and viceversa)
3. Common Utility Functions
4. Utility maximization

# 1 Properties of Preferences

- Nicholson, Ch. 3, pp. 87-88 (69-70, 9th)
- Commodity set  $X$  (apples vs. strawberries, work vs. leisure, consume today vs. tomorrow)
- Preference relation  $\succeq$  over  $X$
- A preference relation  $\succeq$  is *rational* if
  1. It is *complete*: For all  $x$  and  $y$  in  $X$ , either  $x \succeq y$ , or  $y \succeq x$  or both
  2. It is *transitive*: For all  $x$ ,  $y$ , and  $z$ ,  $x \succeq y$  and  $y \succeq z$  implies  $x \succeq z$
- Preference relation  $\succeq$  is *continuous* if for all  $y$  in  $X$ , the sets  $\{x : x \succeq y\}$  and  $\{x : y \succeq x\}$  are closed sets.

- Example:  $X = \mathbb{R}^2$  with map of indifference curves

- Counterexamples:

1. Incomplete preferences. Dominance rule.

2. Intransitive preferences. Quasi-discernible differences.

3. Discontinuous preferences. Lexicographic order

- Indifference relation  $\sim$ :  $x \sim y$  if  $x \succeq y$  and  $y \succeq x$
- Strict preference:  $x \succ y$  if  $x \succeq y$  and not  $y \succeq x$
- Exercise. If  $\succeq$  is rational,
  - $\succ$  is transitive
  - $\sim$  is transitive
  - Reflexive property of  $\succeq$ . For all  $x$ ,  $x \succeq x$ .

- Other features of preferences
  
- Preference relation  $\succeq$  is:
  - *monotonic* if  $x \succeq y$  implies  $x \succ y$ .
  
  - *strictly monotonic* if  $x \succeq y$  and  $x_j > y_j$  for some  $j$  implies  $x \succ y$ .
  
  - *convex* if for all  $x, y$ , and  $z$  in  $X$  such that  $x \succeq z$  and  $y \succeq z$ , then  $tx + (1 - t)y \succeq z$  for all  $t$  in  $[0, 1]$

## 2 From preferences to utility

- Nicholson, Ch. 3
- Economists like to use utility functions  $u : X \rightarrow R$
- $u(x)$  is 'liking' of good  $x$
- $u(a) > u(b)$  means: I prefer  $a$  to  $b$ .
- **Def.** Utility function  $u$  represents preferences  $\succeq$  if, for all  $x$  and  $y$  in  $X$ ,  $x \succeq y$  if and only if  $u(x) \geq u(y)$ .
- **Theorem.** If preference relation  $\succeq$  is rational and continuous, there exists a continuous utility function  $u : X \rightarrow R$  that represents it.

- [Skip proof]

- Example:

$$(x_1, x_2) \succeq (y_1, y_2) \text{ iff } x_1 + x_2 \geq y_1 + y_2$$

- Draw:

- Utility function that represents it:  $u(x) = x_1 + x_2$

- But... Utility function representing  $\succeq$  is not unique

- Take  $3u(x)$  or  $\exp(u(x))$

- $u(a) > u(b) \iff \exp(u(a)) > \exp(u(b))$

- If  $u(x)$  represents preferences  $\succeq$  and  $f$  is a strictly increasing function, then  $f(u(x))$  represents  $\succeq$  as well.

- If preferences are represented from a utility function, are they rational?

- completeness

- transitivity

- Indifference curves:  $u(x_1, x_2) = \bar{u}$
- They are just implicit functions!  $u(x_1, x_2) - \bar{u} = 0$

$$\frac{dx_2}{dx_1} = -\frac{U'_{x_1}}{U'_{x_2}} = MRS$$

- Indifference curves for:
  - monotonic preferences;
  - strictly monotonic preferences;
  - convex preferences

### 3 Common utility functions

- Nicholson, Ch. 3, pp. 100-104 (82-86, 9th)

1. Cobb-Douglas preferences:  $u(x_1, x_2) = x_1^\alpha x_2^{1-\alpha}$

- $MRS = -\alpha x_1^{\alpha-1} x_2^{1-\alpha} / (1-\alpha) x_1^\alpha x_2^{-\alpha} = \frac{\alpha}{1-\alpha} \frac{x_2}{x_1}$

2. Perfect substitutes:  $u(x_1, x_2) = \alpha x_1 + \beta x_2$

- $MRS = -\alpha/\beta$

3. Perfect complements:  $u(x_1, x_2) = \min(\alpha x_1, \beta x_2)$

- $MRS$  discontinuous at  $x_2 = \frac{\alpha}{\beta}x_1$

4. Constant Elasticity of Substitution:  $u(x_1, x_2) = (\alpha x_1^\rho + \beta x_2^\rho)^{1/\rho}$

- $MRS = -\frac{\alpha}{\beta} \left(\frac{x_1}{x_2}\right)^{\rho-1}$
- if  $\rho = 1$ , then...
- if  $\rho = 0$ , then...
- if  $\rho \rightarrow -\infty$ , then...

## 4 Utility Maximization

- Nicholson, Ch. 4, pp. 114–124 (94–105, 9th)
- $X = R_+^2$  (2 goods)
- Consumers: choose bundle  $x = (x_1, x_2)$  in  $X$  which yields highest utility.
- Constraint: income =  $M$
- Price of good 1 =  $p_1$ , price of good 2 =  $p_2$
- Bundle  $x$  is feasible if  $p_1x_1 + p_2x_2 \leq M$
- Consumer maximizes

$$\begin{aligned} & \max_{x_1, x_2} u(x_1, x_2) \\ & s.t. \quad p_1x_1 + p_2x_2 \leq M \\ & \quad x_1 \geq 0, \quad x_2 \geq 0 \end{aligned}$$

- Maximization subject to inequality. How do we solve that?
- Trick:  $u$  strictly increasing in at least one dimension. ( $\succeq$  strictly monotonic)
- Budget constraint always satisfied with equality
- Ignore temporarily  $x_1 \geq 0$ ,  $x_2 \geq 0$  and check afterwards that they are satisfied for  $x_1^*$  and  $x_2^*$ .

- Problem becomes

$$\begin{aligned} \max_{x_1, x_2} & u(x_1, x_2) \\ \text{s.t.} & p_1 x_1 + p_2 x_2 - M = 0 \end{aligned}$$

## 5 Next Class

- Utility Maximization (ctd)
- Utility Maximization – tricky cases
- Indirect Utility Function
